                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                 US-10-720-323-8

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C; Complex: An immunoglobulin beneficially immunoglobulin bonds. In some cases, such as IgA and IgM, the subunits associate into la C; Superfamily: immunoglobulin V region; immunoglobulin homology

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
anti-tumour necrosis factor (TNR) antibody of the invention, The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted antibumanised and/or complementarity determining region (CDR)-grafted antibured by immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TNR antibody compositions, formulations, devices, transgenic animals, transgenic compositions, formulations, devices, transgenic animals, transgenic plants, and methods of making and using them. The antibody comprises at least a portion of an immunoglobulin molecule, especially the present sequence, or either all of the CDRs of the heavy chain (see AAMSIISB-60) or all of the CDRs of the heavy chain (see AAMSIISB-60) or all of the CDRs of the light chain (see AAMSIISB-60) or all of the CDRs of the independing or treating any inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. It is useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as a treriosclerosis, atherosclerosis, restenosis, angina pectoris or arteriosclerosis, atherosclerosis, restenosis, and malaria, a malignant converse and multiple manial infections, pneumonia, leprosy and malaria, a malignant converse and multiple manial infections, pneumonia, leprosy and malaria, a malignant provens and multiple manial infections, pneumonia, leprosy and malaria, a malignant provens and multiple manial infections, pneumonia, leprosy and malaria, a multiple mania, and multiple mania.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lymphoma and multiple myeloma, or a neurological disease such as multiple sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's disease and Creutzfeldt-Jakob disease and
                                                                                                                                                                Novel isolated mammalian anti-tumor necrosis factor antibody, useful for treating sickle cell anemia, diabetes, atherosclerosis, restenosis, angina pectoris, myocardial infarction, leprosy.
                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of the light chain variable region of an anti-tumour necrosis factor (TNF) antibody of the invention. Correspondent Bequence is that or a natural version to present conceed by a human germiline gene in a transgenic mouse used in human monoclonal antibody (mAb) construction. A GenTWV fusion was performed using splen cells from a hybrid mouse containing human correspondent with a parameter were performed using splen cells from a hybrid mouse containing human correspondent to the compilate and constant region antibody transgenes that was immunised with recompilate human tumour necrosis factor (TWP) alpha. Human mabs were obtained that bound immobilised human TWF alpha with apparently high cotained that bound immobilised human TWF alpha with apparently high cotained that bound immobilised human TWF alpha with apparently high cotained the light chain variable region of 2 of the mAbs. TWN14 and protion of the light chain variable region of 2 of the mAbs. TWN14 and CTMN51175, differed by a single amino acid residue. When it the CTMN51175, differed by a single amino acid residue. When the provides human, primate, redent, mammalian, chimaric, humanised and/or complementarity determining region (CDR)-grafted anti-TWF antibody compositions, encoding or complementary nucleic acids, vectors, indimonglobulins, and methods of maxing and using them. The anti-TWF antibody compositions, formulations, devices, transgenic acids, vectors, cransgenic plants, and methods of maxing and using them. The anti-TWF antibody compositions and in AMS1165, or either all of the CDRs of the CDRs of the present sequence and in AMS1165, or either all of the CDRs of the present sequence and in AMS1165, or all of the CDRs of the light chain (see AndS1189-60) or all of the CDRs of the CDRs of the present is an enterioration and publication, an infectious disease in a cell such as rhemmatoid arthritis, gastric ulear, asthma, allergic rhintis, mallers, and methodogy, sickle cell anaemia, diabetes, a cardiovascular disease such as arteriooral culear, asthma, allergic and antipinal disease such as allerandial, chronic myocardial infarction, an infactions present sequence is that of a human Vg/38K-type light chain variable

Also included are the nucleic acids encoding the CDR8, a vector comprising the nucleic acids, a host cell comprising the vector, an anti-idiotype antibody that binds to the ant-dual integrin, a medical device comprising the antibody suitable for administration by parenteral, subcutaneous, intravenous, intravenous, intravenous, intraceleblar, intraceptial intraceleblar, intraceptial processions, intracepting a the antibody is useful for diagnosing or treating a dual integrin related condition in an animal for example, immune related disease such as rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnosing or treating dual integrin related condition such as rheumatoid
arthritis, gastric ulcer, asthma, atherosclerosis, restenosis.
                                                                                                                                                                                                                                                                           9

Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LDR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products
                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                               mimetic; CDR mimetibody; gene therapy; transgenic; immune; cardiovascular; infectious; malignant; neurologic disease; anaemia; immunomodulator; cardiant; antimicrobial; cytostatic; neuroprotective;
           arteriosclerosis, atherosclerosis, restenosis, angina pectoris, myocardial infarction, infectious disease in a cell such as bacterial, viral, and fungal infections, pneumonia, leprosy, malaria, malignant disease such as leukaemia, chronic myelocytic leukaemia Burkitt's lymphoma, multiple myeloma, neurological disease such as multiple sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's disease, creutzfeldt-Jakob disease and many other diseases given in the specification. The present sequence is an anti-dual integrin human variable region containing at least one of the six CDRs listed above
                                                                                                                                                                                                                                                                                                                                       1 EIVLTQSPATLSLSPGERATLSCRASQSVSSYLAWYQQKPGQAPRLLIYDASNRATGIPA
                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     variable region comprising human framework or ligand binding region, useful for preparing a composition for treating e.g., immune,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New CDR mimetibody comprising a portion of a heavy or light chain

Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR minetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms
that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiolar, infectious, malignant and/ or neurologic diseases, as well as anamia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This polypeptide sequence is an erythropoietin light chain mimetibody of the

The invention describes an isolated binding member comprising at least one binding domain capable of specifically binding Streptococcus preumoniae surface adhesin A (FBaA) protein, the binding domain having a dissociation constant K for PaAA which is less than 1 x10 -6 M. Also described are: an isolated nucleic acid molecule encoding at least a part of the binding member described above; a vector comprising the nucleic acid molecule of (1); a host cell comprising the nucleic acid molecule of (1); a cell line engineered to express the binding member described above; detecting or diagnosing a disease or disorder associated with member described above, the antibody being labeled; and a pharmaceutical composition comprising a binding member described above. The binding member is useful for producing a pharmaceutical composition for the treatment of Pneumococcus infection. The binding member, methods and

C The present sequence is that of the light chain variable region of anti-
C tumour necrosis factor (TMY) human recombinant monoclonal antibodies

(mAbs) TNV14 and TNV15. These are human mabs produced from a GenTNV

(tusion using splean cells from a hybrid mouse containing human variable

and constant region antibody transgenes that was immunised with human TNF

alpha. The human mAbs bind immobilised human TNF alpha with high avidity

and have a totally human 1921, Kappa isotype. The mature portion of the

CC light chain variable region is identical to that of the Vg/18-type light

CC dight germline sequence (see AAM51173) show a single amino acid difference.

The invention provides human, primate, mammalian, rodent, chimeric,

the invention provides human, primate, mammalian, rodent, chimeric,

TNF antibodies, immunoglobulins, cleavage products and other specified

CC options and variants, as well as anti-TNF antibody compositions,

Encoding or complementary nucleic acids, vectors, host cells,

CC ompositions, formulations, devices, transgenic animals, transgenic

CC options and variants, as well as anti-TNF antibody compositions,

CC ompositions, formulation of an immunoglobulin molecule, sepecified

CC omprises at least a portion of an immunoglobulin molecule, the heavy chain and/or light chain variable regions given in the present

CC omprises at least a portion of an immunoglobulin molecule,

CC omprises at least a portion of an immunoglobulin molecule,

CC omprises at least a portion of an immunoglobulin molecule,

CC omprises at least a portion of an immunoglobulin molecule,

CC omprises at least a portion of an immunoglobulin molecule,

CC office AAM51158-60) or all of the CDRs of the heavy chain

CC office AAM51158-60) or all of the CDRs of the heavy chain

CC office AAM51158-60) or all of the CDRs of the heavy chain

CC office AAM5116 or elemental of the CDRs of the heavy chain

CC office and thology in the colons, or organical and organical infection in a cell infection organical and organical infect

```
The present sequence is that of the light chain variable region of anti-
tumour necrosis factor (TNF) human recombinant monoclonal antibodies
tumour necrosis factor (TNF) human recombinant monoclonal antibodies
tumour necrosis factor and by the sequence of them a GenTNV
fusion using spleen cells from a hybrid mouse containing human variable
and constant region antibody transgenes that was immunised with human TNF
and have a totally human IgG1, kappa isotype. The mature portion of the
light chain variable region differs from that of the Vg/38-type light
chain germline sequence (see AAM51173) by a single residue (Tyr-50
replacing Ser). The light chain variable regions of 2 other human mAbs
(see AAM51174) were identical to the germline sequence. The invention
provides isolated human, primate, rodent, mammalian, chimaric, humanised
and/or complementarity determining region (CDR) grafted anti-TNF
antibodies, immunoglobulins, cleavage products and other specified
portions and variants, as well as anti-TNF antibody compositions,
compositions, formulations, devices, transgenic animals, transgenic
plants, and methods of making and using them. The anti-TNF antibody
compress at least a portion of an immunoglobulin molecule, especially
the heavy chain and/or light chain variable regions given in the present
sequence and in AAM31165, or either all of the CDRs of the heavy chain
(see AAM51158-60) or all of the CDRs of the heavy chain

inhibit TNF binding to receptor, or provide Arthritic Index improvement in a mouse model. They are useful for diagnosing or treating a TNF related condition in a cell, tissue, organ or animal (claimed) such as related condition in a cell, tissue, organ or animal (claimed) such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as arteriosclerosis, atherosclerosis, restenosis, angina pectoris or myocardial infarction, an infectious disease in a cell such as bacterial, viral, and fungal infections, pneumonia, leprosy and malaria, a malignant disease such as leukaemia, chronic myelocytic leukaemia, Burkitt's luphoma and multiple myeloma, or a neurological disease such as multiple sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences for human monoclonal antibodies which bind specifically to the HER2/neu growth factor receptor (also known as erbB2). These are designated 3-F2, 1-D2 and 2-E8. They can be used in the immunotherapy-based treatment and prognosis of cancers, particularly adenocarcinomas such as salivary gland, stomach, kidney, mammary gland, lung and squamous cell carcinomas, and ovarian cancer. The present sequence is part of an antibody of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; HER2; neu; erbB2; oncogene; cancer; antibody; immunotherapy; 3-F2;

disease, Hashimoto's thyroiditis), Sjogren's syndrome, pulmonary inflammation (e.g., asthma, chronic obstructive pulmonary disease, pulmonary asrocidosis, lymphocytic alveolitis), transplant rejection, spinal cord injury, brain injury (e.g., stroke), neurodegenerative diseases (e.g., Alzheimer's disease, Parkinson's disease), gingivitis, gene therapy-induced inflammation, diseases of angiogenesis, inflammatory kidney disease (e.g., IgA nephropathy, membranoproliferative atherospiritis, rapidly progressive glomerulonephritis), or atherosclerosis. It is also useful for treating a viral or bacterial infection involving unwanted IP-10 activity in a subject, where the viral infection is mediated by HIV, HCV, HSV-1 or SARS virus. The present sequence represents the amino acid sequence of a human IP10 monoclonal antibody light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (DPG). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (1) or a pharmaceutical amount of (1); and (3) a method for detecting OPGL in a biological sample, comprising contacting the

```

treating bone disorders, such as osteoporosis, bone loss from arthritis,

```
has
         to OPGI, and measuring the level of bound antibody in the sample. (1) has osteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis. Paget's disease or osteopenia. The antibody (1) may also be used for that produce the protein. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                          9
under conditions that allow for binding of the antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated antibody that specifically binds osteoprotegerin ligand, useful for diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis, Paget's disease or osteopenia.

The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGI). Also described: (I) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody to OPGL, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or

The present sequence is that of human anti-interleukin-1 receptor type 1 (IL-IR1) monoclonal antibody (MAb) 26F5 kappa chain variable region. Human MAbs to IL-IR1 were prepared using the HCO7 etrain of transgenic mice, which expresses human antibody genes. These mice were immunised with purified recombinant IL-IR1, and splenocytes from immunised mice were fused to a mouse myelona cell line to generate hybridomas. Hybridomas which secreted a MAb that bound with high avidity to IL-IR1 were selected. The MAbs inhibit IL-1 signalling by competing with IL-1beta and IL-1alpha binding to IL-IR. These MAbs, as well as single chain antibodies single chain FV antibodies, Fab antibodies, Fab' antibodies and (Fab') 2 antibodies derived from them, are used in methods of treating
                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, monoclonal antibody, antibody; interleukin-1; receptor;

The present sequence is that of the light chain variable region of human anti-tumour necrosis factor (TNF) monoclonal antibody 9E7. This human TNF reactive IgG monoclonal antibody was generated by cloning variable and constant region DNA in vector pC4 and expression in CHO cells. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanized and/or CDR-grafted anti-TNF antibodies, immunoglobulins, their cleavage products, other specified portions and variants, as well as anti-TNF antibody compositions, nucleic acids encoding these, vectors, host cells, methods for producing the antibodies using a host cell, transgenic animal or transgenic plant or plant cell, and therapeutic compositions, methods are useful for diagnoshing or treating an anti-TNF related condition, e.g. cancer, anotexia, cachexia, or an immune, cardiovascular,

The present invention relates to a mammalian anti-tumour necrosis factor (TNF) antibody capable of inhibiting binding of TNF alpha to TNF receptor. The invention is useful for diagnosing or treating an anti-TNF related condition in a cell, tissue, organ or animal and in immunotherapy. The invention is also useful for treating TNF related diseases chosen from obsesty, immune related diseases unch as rheumatoid arthritis, cardiovascular disease such as stroke, malignant disease such as stroke, malignant disease such as bacterial or viral infections such as hapatitis. The present sequence is the human SETLC light chain protein (variable region and J-region). This sequence is used in the exemplification of the invention.
                         Example 4; Fig 3; 45pp; English.

This sequence is that of complementarity determining region 1 (CDR1) of the heavy chain of an anti-tumour necrosis factor (TNF) antibody. The invention provides isolated human, primate, roder, mammalian, chimeric, humanised and/or CDR-grafted anti-TNF antibodies, immunoglobulins, cleavage products and other specified portions and variants, as well as anti-TNF antibody compositions, formulations, devices, transgenic anti-TNF antibody compositions, formulations, devices, transgenic anti-TNF antibody compositions, formulations, devices, transgenic anti-TNF antibody comprises at least a portion of an immunoglobulin molecule, especially the heavy chain and/or 11ght chain variable regions given in AAMS1165-66, or either all of the CDRs of the heavy chain (see AAMS1156-66, or either all of the CDRs of the heavy chain (see AAMS1156-60) or all of the CDRs of the light chain (see AAMS1151-61). The antibody may inhibit TNF-induced cell adhesion molecules, inhibit TNF chinding to receptor, or provide Arthritic Index improvement in a mouse model. It is useful for diagnosing or treating a TNF related condition in the useful for diagnosing or treating a TNF related condition in gastric ulcer, asthma, allergic rhinitis, Cohn's pathology, sickle cell anaemia, diabetes, a cardiovascular disease such as arteriosclerosis, atherosclerosis, reetenosis, angina pectoris or myocardial infarction, an infections pheumonala, leptory and malaria, a malignant disease such as Infections preumonala, leptorsy and malaria, a malignant disease such as Infections pleumonala, leptorsy and malaria, a malignant disease such as Infections and multiple leukaemia, chronic myolocytic leukaemia, Burkitt's lymphoma and multiple

Also included are the nucleic acids encoding the CDRs, a vector comprising the nucleic acids, a host cell comprising the vector, an anti-idiotype antibody that binds to the ant-dual integrin, a medical device comprising the antibody unitable for administration by pareneral, subcutaneous, intrandeominal, intraorential, intracartilalinginous, intracartilatinginous, intracartilatinginous, intracartilatinginous, intracartilatinginous, intracalebellar, or other routes as given in specification. The antibody is useful for diagnosing or treating a dual integrin related condition in an animal for example, immune related disease such as rheumatoid arthritis, gastric ulcer, asthma, allergic rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, cardiovascular disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; antibody; dual integrin; CDR; heavy chain variable region; HC CDR; medical device; immune related disease; rheumatoid arthritis; gastric ulcer; asthma; allergic rhinitis; Crohn's pathology; sickle cell anaemia; diabetes; cardiovascular disease; arteriosclerosis; atherosclerosis; restenosis; angina pectoris; myocardial infarction; infectious disease; pneumonia; leprosy; malaria; malignant disease; leukaemia; chronic myelocytic leukaemia; multiple myeloma; neurological disease; multiple sclerosis; Parkinson's disease; Alzheimer's disease; Creutzfeldt-Jakob disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated mammalian anti-dual integrin antibody, useful for diagnosing or treating dual integrin related condition such as rheumatoid arthritis, gastric ulcer, asthma, atherosclerosis, restenosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a composition that contains a bispecific single chain antibody consisting of at least two domains, where one of domains binds to human epithelial cell adhesion molecule (EpCAM) antigen, and the second domain binds to human CD3 antigen. The bispecific antibody construct of the invention is useful for the prevention, treatment or amelioration of a tumorous disease, such as an epithelial or minimal residual cancer. The present anno acid sequence represents a mutant CDRH3 peptide that was used in an example of the invention.
arteriosclerosis, atherosclerosis, restenosis, angina pectoris, myocardial infarction, infectious disease in a cell such as bacterial, viral, and fungal infections, pneumonia, leprosy, malaria; malignant disease such as leukaemia, chronic myelocytic leukaemia, Burkitt's lymphoma, multiple myeloma; neurological disease such as multiple sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's disease, Creutzfeldt-Jakob disease and many other diseases given in the specification. The present sequence is an anti-dual integrin human heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New pharmaceutical composition having a bispecific single chain antibody construct, useful for preventing, treating or ameliorating a tumorous disease, such as an epithelial or minimal residual cancer.

This invention relates to novel pharmaceutical compositions that comprise a bispecific single chain antibody construct, a nucleic acid sequence concoling the antibody construct and a vector that contains the mucleic acid sequence. Specifically, it refers to an antibody construct that contains binding domains specific for the human T cell differentiation candings CD3 and CD19, with specific variable heavy and light chain regions. In particular such constructs include, from the N· to C-termini, in the order, VH(CD19)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD3)-VL(CD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of bispecific single chain antibody construct, nucleic acid sequence encoding the antibody construct, vector containing the nucleic acid or host transformed with the vector for the treatment of e.g. proliferative

The invention relates to a cytotoxically active CD3 specific binding construct comprises a first domain specifically binding to human CD3 and an Ig-derived second binding domain. The CD3 specific binding construct above or the construct produced by the process, nucleic acid molecule, vector, or host is useful for the preparation of a pharmaceutical composition for the prevention, treatment, or amelioration of a proliferative disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an inflammatory disease, viral disease, allergic reactions, parafit vectors, graft-versus-host disease, or host-versus-graft diseases. The cytotoxically active CD3 specific binding construct is useful for treating, preventing, or ameliorating disorder, an autoimmune disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an infectious disease, an infectious disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host diseases, or host-versus-graft diseases. The present sequence represents the amino acid sequence of a non-delmmunized anti-CD3 cassette heavy chain variable region CDR.

The invention relates to a cytotoxically active CD3 specific binding construct comprises a first domain specifically binding to human CD3 and an Ig-derived second binding domain. The CD3 specific binding construct above or the construct produced by the process, nucleic acid molecule, vector, or host is useful for the preparation of a pharmaceutical composition for the prevention, treatment, or amelioration of a composition for the prevention, treatment, or amelioration of a confidency, an autoimmune disease, a tumor, an infectious disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host disease, or construct is useful for treating, preventing, or ameliorating construct is useful for treating, preventing, or ameliorating disease, allergic reactions, parasitic reactions graft-versus-disease, an immunological disoace, an autoimmune disease, an inflammatory disease, an immunological disoace, allergic reactions, parasitic reactions graft-versus-host disease, or host-versus-graft diseases. The present sequence represents the amino acid sequence of a non-deimmunized anti-CD3 cassette heavy chain variable
